EE 361002 Signal and System HW11 Answer

6.21

(a)
$$Y(jw) = H(jw)X(jw) \Rightarrow -2jwX(jw) \Rightarrow Y(t) = -2\frac{dX(t)}{dt}$$

 $H(jw) = \begin{cases} -2jw, & |w| < l \end{cases}$
 $o, & else$
(b) $X(t) = e^{jt} \Rightarrow y(t) = -j\frac{de^{jt}}{dt} = -2je^{jt}$
 $= -2(w_0 cos(w_0t)u(t) + sinw_it s(t))$
 $= -2(w_0 cos(w_0t)u(t) + sinw_it s(t))$
 $= -2w_0 cos(w_0t)u(t)$

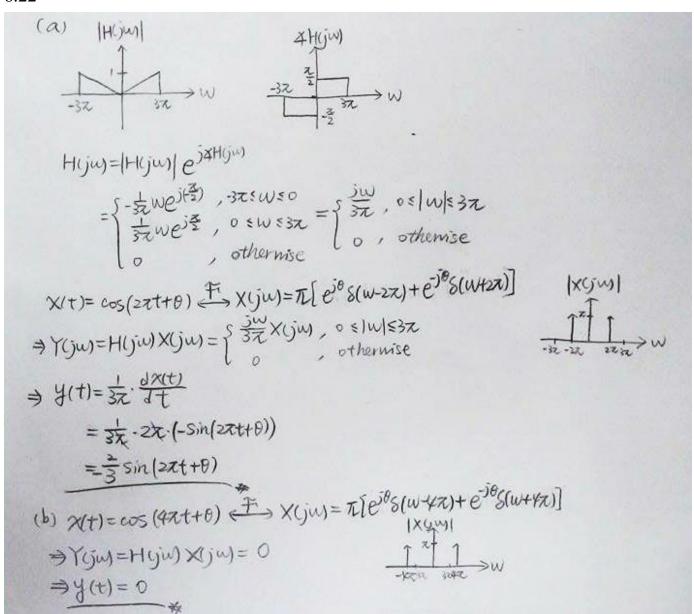

$$Y_{(j\omega)} = -2j\omega X_{(j\omega)} \Rightarrow y(t) = -2\frac{dX(t)}{dt}$$

$$(c) X_{(j\omega)} = \frac{1}{(j\omega)(6+j\omega)} \Rightarrow Y_{(j\omega)} = \frac{-2}{(4+j\omega)} \Rightarrow y(t) = -2\frac{-6t}{4t} = 4t$$

$$(d) X_{(j\omega)} = \frac{1}{2+j\omega} \Rightarrow X(t) = \frac{-2t}{4t} = 4t$$

$$(d) X_{(j\omega)} = \frac{1}{2+j\omega} \Rightarrow X(t) = \frac{-2t}{4t} = 4t$$

$$(d) X_{(j\omega)} = \frac{1}{2+j\omega} \Rightarrow X(t) = \frac{-2t}{4t} = 4t$$

(c)
$$H(j\omega) = |H(j\omega)| + |H(j\omega)|$$

$$= \left(-\frac{1}{3\pi}\omega \cdot (e^{j(\frac{\pi}{2})}) - 3\pi \le \omega \le 0\right)$$

$$= \left(\frac{1}{3\pi}\omega \cdot (e^{j(\frac{\pi}{2})}) - 3\pi \le \omega \le 3\pi\right)$$

$$= \left(\frac{1}{3\pi}\omega \cdot (e^{j(\frac{\pi}{2})}) - 3\pi \le \omega$$

$$\alpha_{k} = \frac{1}{T} \int_{T} \chi(t) e^{-jk\omega_{o}t} dt$$

$$\chi(t) = \sum_{k=-\infty}^{\infty} \alpha_{k} e^{-jk\omega_{o}t}$$

$$J_{n}(c) , \quad \omega_{o} = 2\pi$$

$$a_1 = a_{-1}^* = \int_0^{1/2} \sin \omega t \times e^{-j \omega t} dt$$

積化和差
$$=\frac{1}{2}$$
 $\int_{-\infty}^{\infty} \sin(4\pi t) + \sin \theta - i\cos(4\pi t) + i\cos \theta$

$$= \frac{1}{2} \left(-\cos 4\pi t - i\sin 4\pi t + it \right) \Big|_{0}^{2} = \frac{1}{45}$$

$$\Rightarrow y(t) = \frac{1}{3\pi} \frac{dxt}{dt} = \frac{1}{3\pi} \times \frac{d(\frac{1}{\pi} + \frac{1}{4})}{dt} \frac{e^{j\omega_0 t}}{dt} - \frac{1}{45}} \frac{e^{j\omega_0 t}}{dt}$$

$$= \frac{1}{3\pi} \frac{d(\frac{1}{\pi} + \frac{1}{2} \times \sin(\omega_0 t))}{dt}$$

6.25. (a) We may write $H_a(j\omega)$ as

$$H_a(j\omega) = \frac{(1-j\omega)}{(1+j\omega)(1-j\omega)} = \frac{1-j\omega}{2}.$$

Therefore,

$$\triangleleft H_{\alpha}(j\omega) = \tan^{-1}[-\omega].$$

and

$$\tau_a(\omega) = -\frac{d \triangleleft H_a(j\omega)}{d\omega} = \frac{1}{1 + \omega^2}.$$

Since $\tau_a(0) = 1 \neq 2 = \tau_a(1)$, $\tau_a(\omega)$ is not a constant for all ω . Therefore, the frequency response has nonlinear phase.

(b) In this case, H_b(jω) is the frequency response of a system which is a cascade combination of two systems, each of which has a frequency response H_a(jω). Therefore,

$$\triangleleft H_b(j\omega) = \triangleleft H_a(j\omega) + \triangleleft H_a(j\omega)$$

and

$$\tau_b(\omega) = -2 \frac{d \triangleleft H_a(j\omega)}{d\omega} = \frac{2}{1 + \omega^2}.$$

Since $\tau_b(0) = 2 \neq 4 = \tau_b(1)$, $\tau_b(\omega)$ is not a constant for all ω . Therefore, the frequency response has nonlinear phase.

(c) In this case, H_c(jω) is again the frequency response of a system which is a cascade combination of two systems. The first system has a frequency response H_a(jω), while the second system has a frequency response H₀(jω) = 1/(2 + jω). Therefore,

$$\triangleleft H_b(j\omega) = \triangleleft H_a(j\omega) + \triangleleft H_0(j\omega)$$

and

$$\tau_{\rm c}(\omega) = -\frac{d \triangleleft H_a(j\omega)}{d\omega} - \frac{d \triangleleft H_0(j\omega)}{d\omega} = \frac{1}{1+\omega^2} + \frac{2}{4+\omega^2}.$$

Since $\tau_c(0) = (3/2) \neq (3/5) = \tau_c(1)$, $\tau_b(\omega)$ is not a constant for all ω . Therefore, the frequency response has nonlinear phase.

6.27. (a) Taking the Fourier transform of both sides of the given differential equation, we obtain

$$H(j\omega) = \frac{Y(j\omega)}{X(j\omega)} = \frac{1}{2+j\omega}.$$

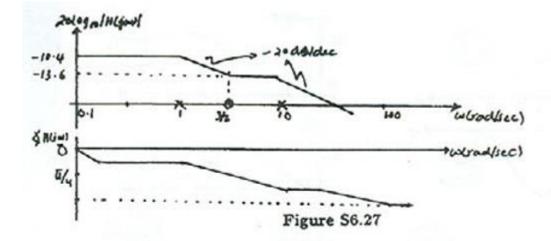

The Bode plot is as shown in Figure \$6.27.

(b) From the expression for $H(j\omega)$ we obtain

$$\triangleleft H(j\omega) = -\tan^{-1}(\omega/2).$$

Therefore,

$$\tau(\omega) = -\frac{d \triangleleft H(j\omega)}{d\omega} = \frac{2}{4 + \omega^2}.$$

(c) Since
$$x(t) = e^{-t}u(t)$$
,

$$X(j\omega) = \frac{1}{1+j\omega}.$$

Therefore,

$$Y(j\omega) = X(j\omega)H(j\omega) = \frac{1}{(1+j\omega)(2+j\omega)}.$$

(d) Taking the inverse Fourier transform of the partial fraction expansion of Y (jω), we obtain

$$y(t) = e^{-t}u(t) - e^{-2t}u(t).$$

(e) (i) Here,

$$Y(j\omega) = \frac{1+j\omega}{(2+j\omega)^2}.$$

Taking the inverse Fourier transform of the partial fraction expansion of $Y(j\omega)$, we obtain

$$y(t) = e^{-2t}u(t) - te^{-2t}u(t).$$

(ii) Here,

$$Y(j\omega) = \frac{1}{(1+j\omega)}.$$

Taking the inverse Fourier transform of $Y(j\omega)$, we obtain

$$y(t) = e^{-t}u(t).$$

(iii) Here,

$$Y(j\omega) = \frac{1}{(1+j\omega)(2+j\omega)^2}.$$

Taking the inverse Fourier transform of the partial fraction expansion of $Y(j\omega)$, we obtain

$$y(t) = e^{-t}u(t) + \frac{1}{2}e^{-2t}u(t) - te^{-2t}u(t).$$
